

ESOPHAGEAL MOTILITY AND REFLUX TESTING

What, when and how to measure?

SUSPECTED MOTILITY DISORDER

Dysphagia/odynophagia: Blocked/painful passage of food through the oesophagus

Heartburn: Retrosternal burning sensation („Magenbrennen“)

Regurgitation: Effortless retrograde movement of esophageal or gastric contents

Chest pain

Globus sensation: Lump in the throat, not resolved by swallowing or throat clearing

DYSPHAGIA

Sensation of impaired passage of ingested food/liquids on the way from the oral cavity to the stomach

History:

Localisation: cervical, retrosternal?

Affects solids only or solids and liquids?

Temporal course: progressive?, intermittent?

80-85% distinction between oropharyngeal vs. oesophageal dysphagia by careful history

Hila A & Castell DO 2003

HIGH RESOLUTION ESOPHAGEAL MANOMETRY STANDARD PROTOCOL CHICAGO CLASSIFICATION VERSION 4.0[©]

STUDY PROCEDURE

Study begins in supine position [use supine normative values]

- ≥ 60 second adaptation period
- Document position with at least 3 deep inspirations
- ≥ 30 second baseline period
- 10 supine wet (5mL) swallows
- 1 multiple rapid swallow (MRS) sequence (MRS may be repeated up to 3 sequences if failed attempt or abnormal response)

Change position to upright [use upright normative values]

- ≥ 60 second adaptation period
- Document position with at least 3 deep inspirations
- ≥ 30 second baseline period
- ≥ 5 upright wet (5mL) swallows
- 1 rapid drink challenge

If no major motility disorder is found consider the following manometric evaluations

- For high probability of a missed EGJ outflow obstruction: Solid test swallows, solid test meal, and/or pharmacologic provocation
- For suspected rumination/belching disorder: Post-prandial high-resolution impedance observation

If equivocal results are found and/or there is suspicion for an obstruction that does not fulfill criteria for achalasia, consider the following supportive tests

- Timed barium esophagram, preferably with tablet
- Endoluminal functional lumen imaging planimetry (FLIP)

Esophageal motility disorders on high-resolution manometry:
Chicago classification version 4.0[©]

EGJ PRESSURE TOPOGRAPHY

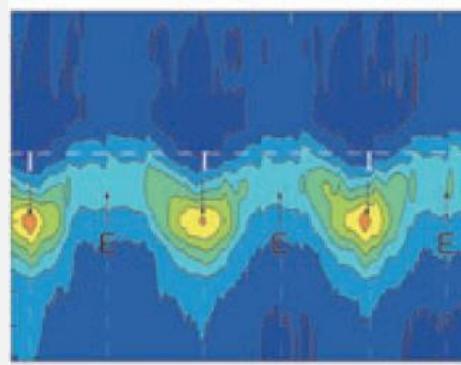

Line tracings on top are 1 cm proximal (blue) and distal (red) to the RIP mark

Identify pressure zone at the EGJ

Respiratory phase:
I = Inspiration
E = Expiration

RIP = Respiratory pressure inversion point ≈ border between abdominal and thoracic pressure compartment, i.e. pressure increases with inspiration distal and decreases proximal to this level

Type I

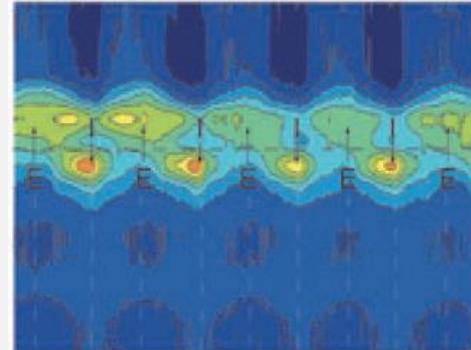

RIP

EGJ TOPOGRAPHY TYPES

Type I:

Complete overlap of LES and diaphragmatic crura

Type II

RIP

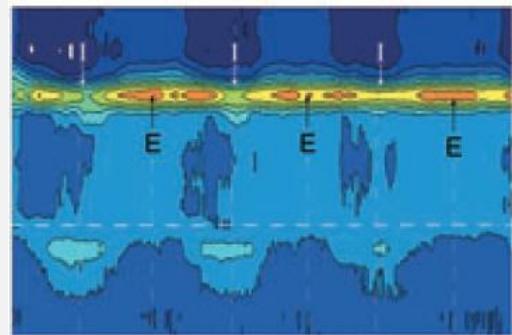

Type II:

Separation of LES and diaphragm 1-2 cm

Type III:

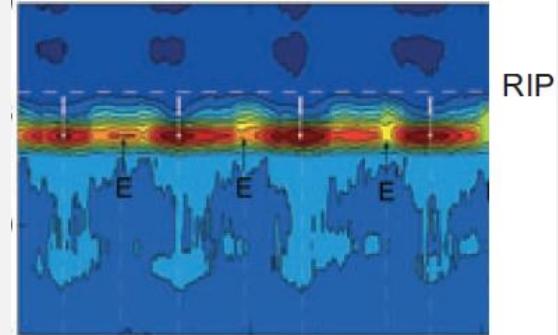

Distance between LES and diaphragm >2 cm
(=hiatal hernia)

Type IIIa

RIP

Type IIIb

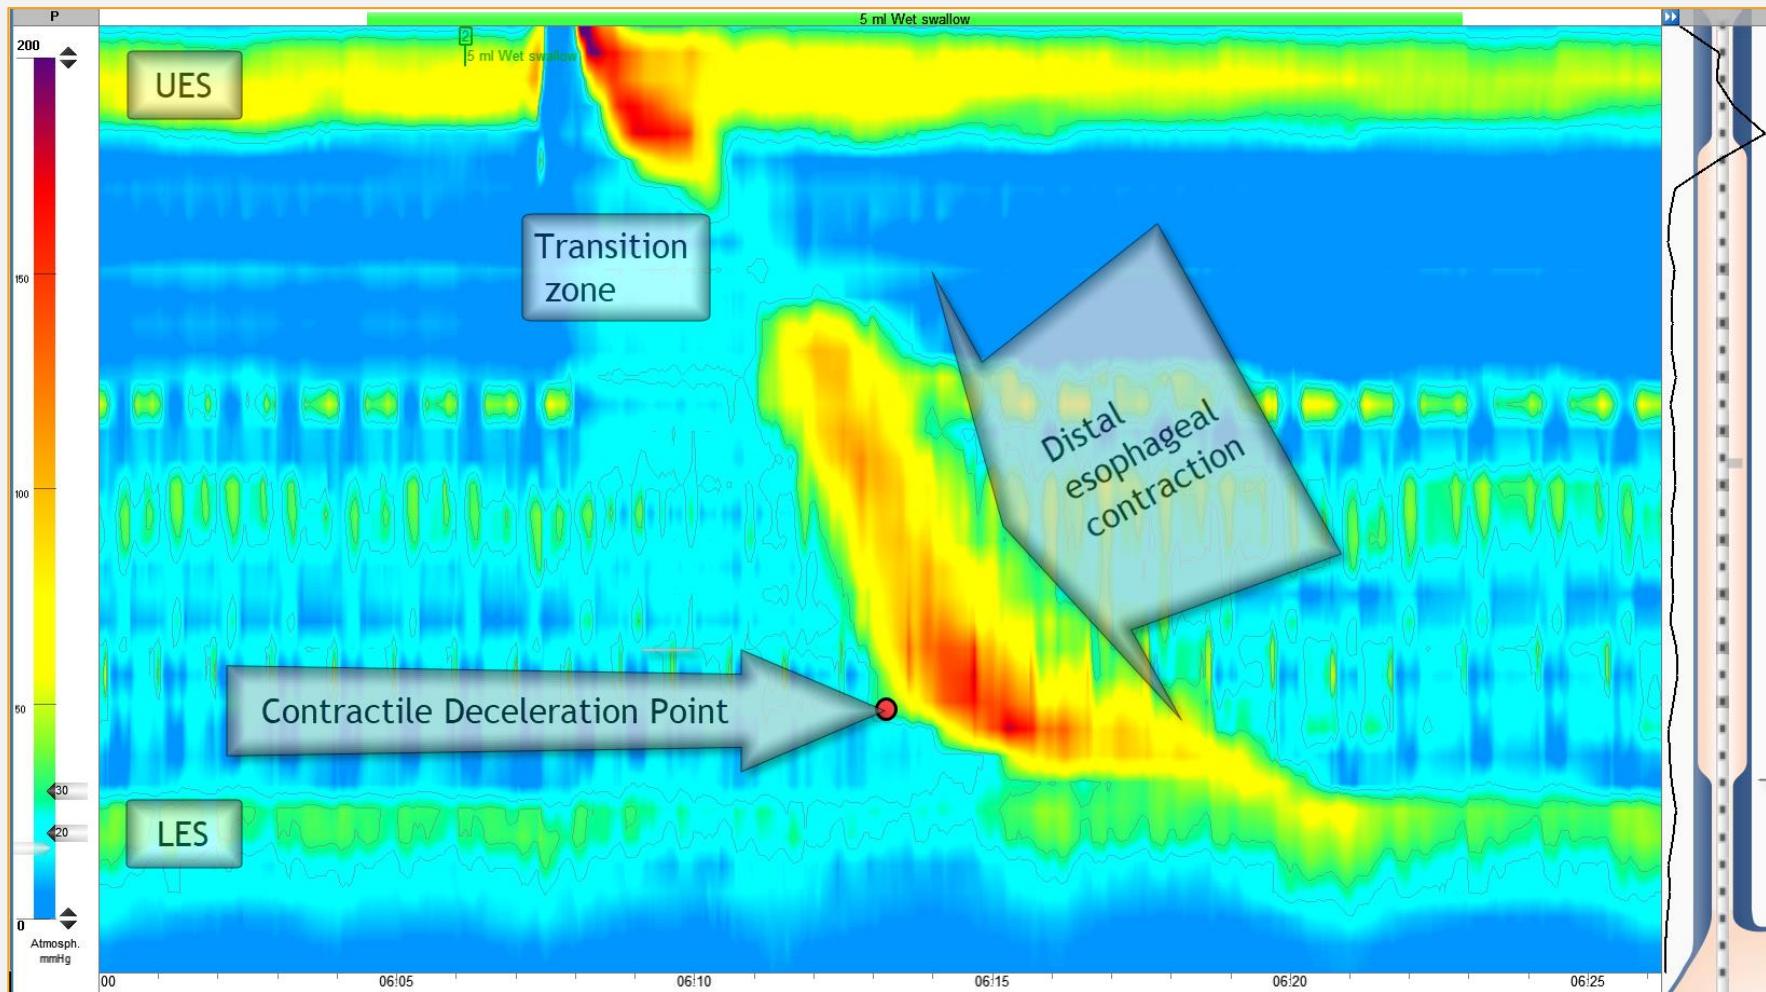

RIP

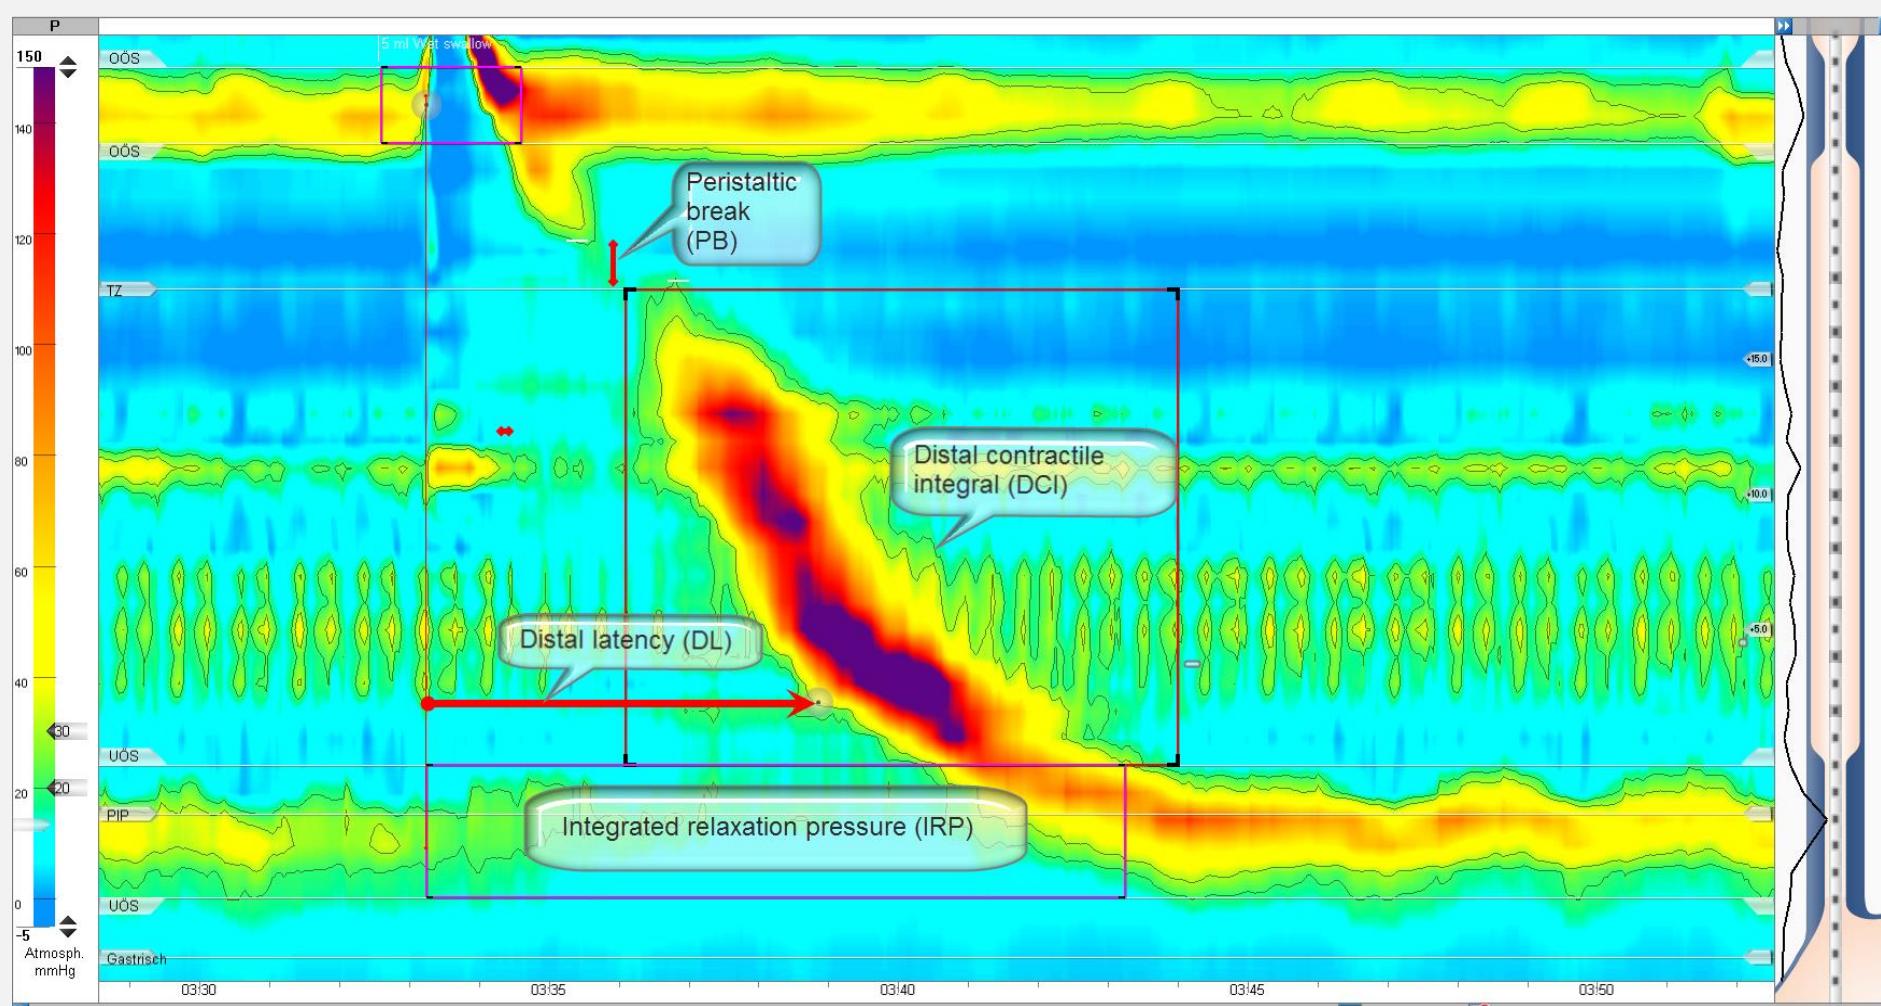

IIIa: Respiratory inversion point (RIP)
at level of diaphragm

IIIb: RIP at level of LES

Pandolfini JE et al. Am J Gastroenterol 2007;102:1056–1063

LANDMARKS

Apply Chicago Metrics:

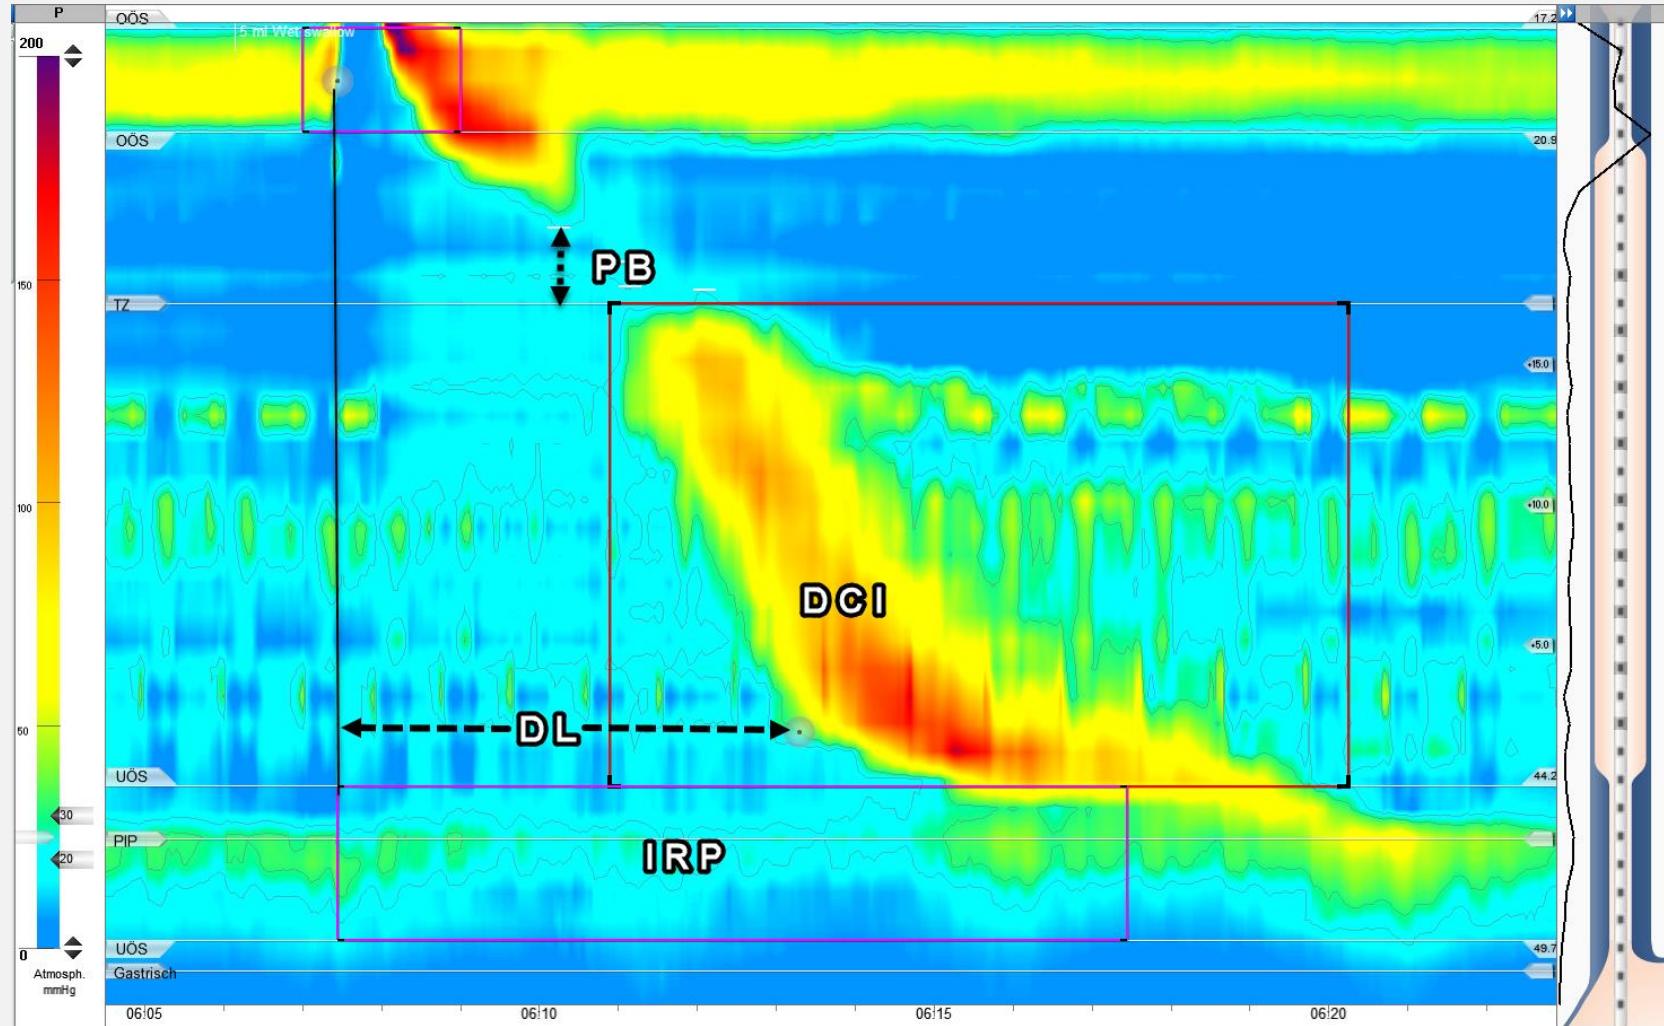

IRP: Integrated Relaxation Pressure (mmHg)

DCI: Distal Contractile Integral (mmHg.s.cm), use 20 mmHg isobaric contour

DL: Distal Latency, use 30 mm Hg isobaric contour

PB: Peristaltic Break, length of interruption in 20 mmHg isobaric contour

PRESSURE TOPOGRAPHY METRICS

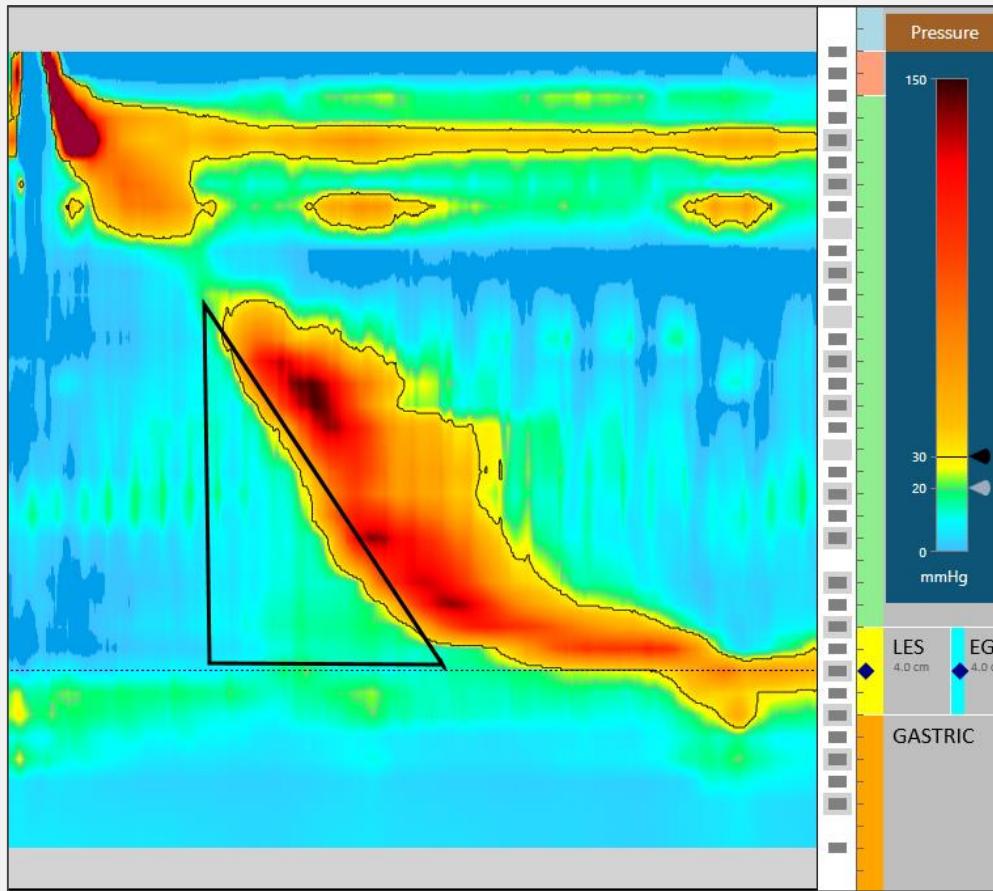

PB = Peristaltic Break

DCI = Distale Contractile Integral

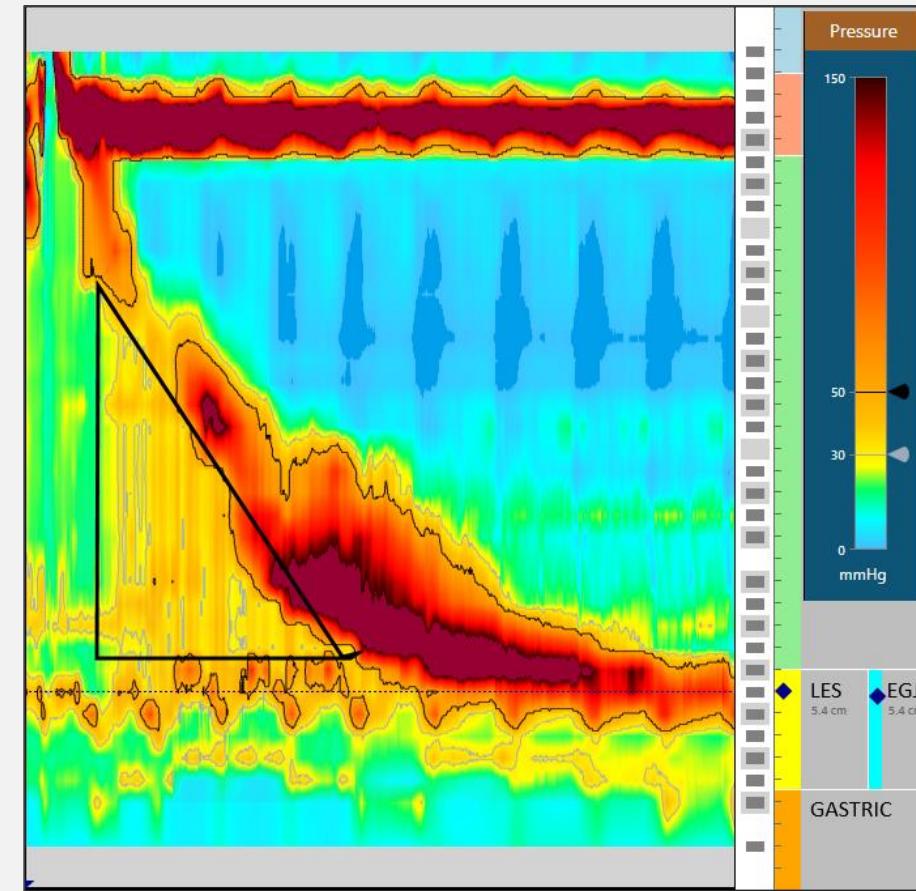

DL = Distal Latency

IRP = Integrated Relaxation Pressure

PRESSURIZATION TYPES I

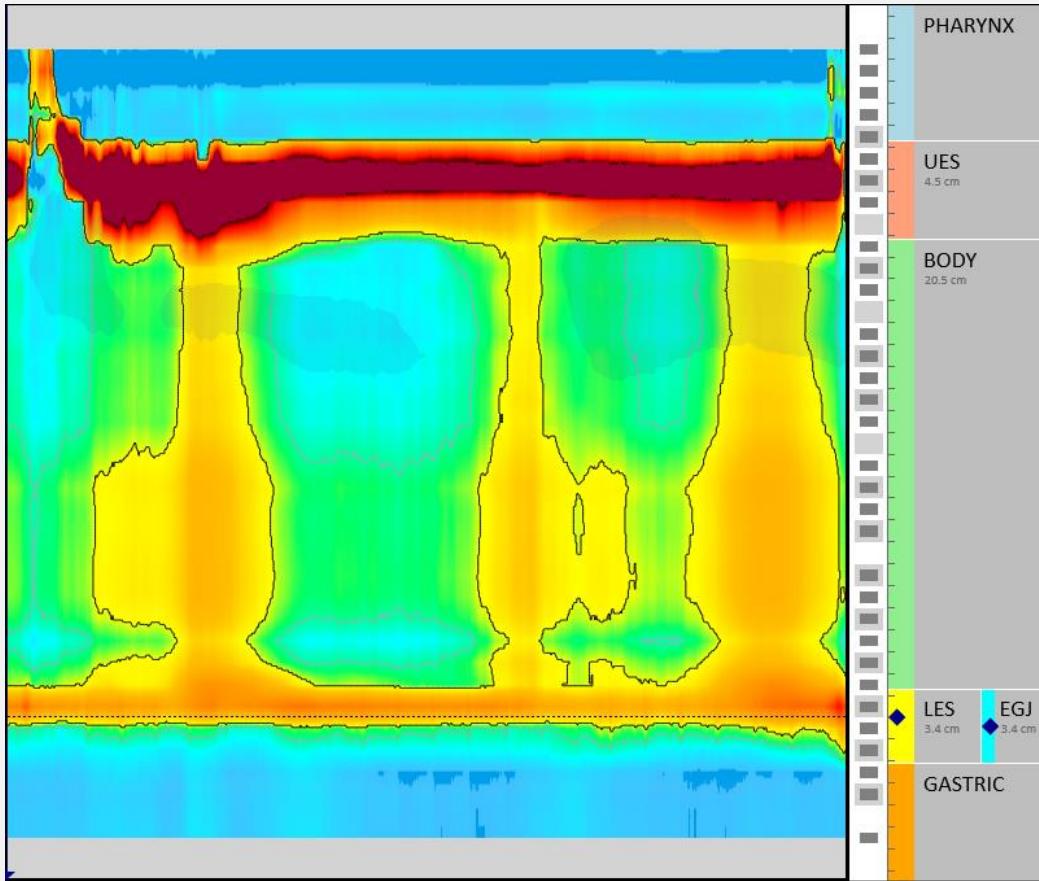

Normal = no pressure >30 mmHg before onset of the contraction wave. Isocontours at 20 and 30 mmHg (standard setting).

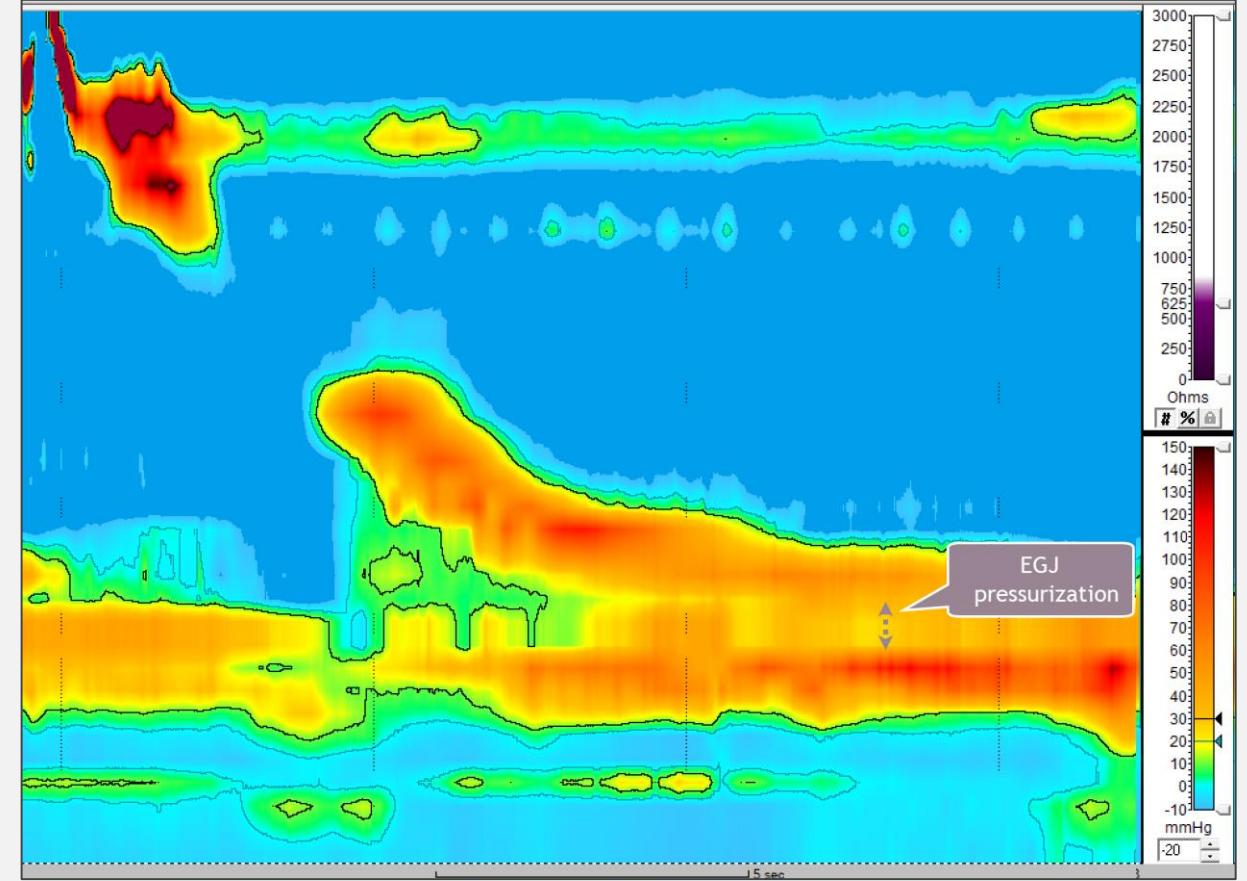

Compartmentalized pressurization = pressure >30 mmHg ahead of the contraction wave. Isocontours at 30 and 50 mmHg.

PRESSURIZATION TYPES II

Panesophageal pressurization: No peristaltic contraction wave. Pressure >30 mmHg extending between UES and LES.

EGJ pressurization: Pressure >30 mmHg extending between UES and diaphragm in EGJ type III.

PRESSURE TOPOGRAPHY METRICS

Integrated Relaxation Pressure (IRP, mmHg):

Mean of the 4 s of maximal deglutitive relaxation in the 10-s window beginning at UES relaxation. Contributing times can be contiguous or non-contiguous (e.g., interrupted by diaphragmatic contraction). Referenced to gastric pressure.

Distal Contractile Integral (DCI, mmHgscm):

Amplitude *duration *length of the distal esophageal contraction exceeding 20 mmHg from the transition zone to the proximal margin of the LES. Referenced to atmospheric pressure

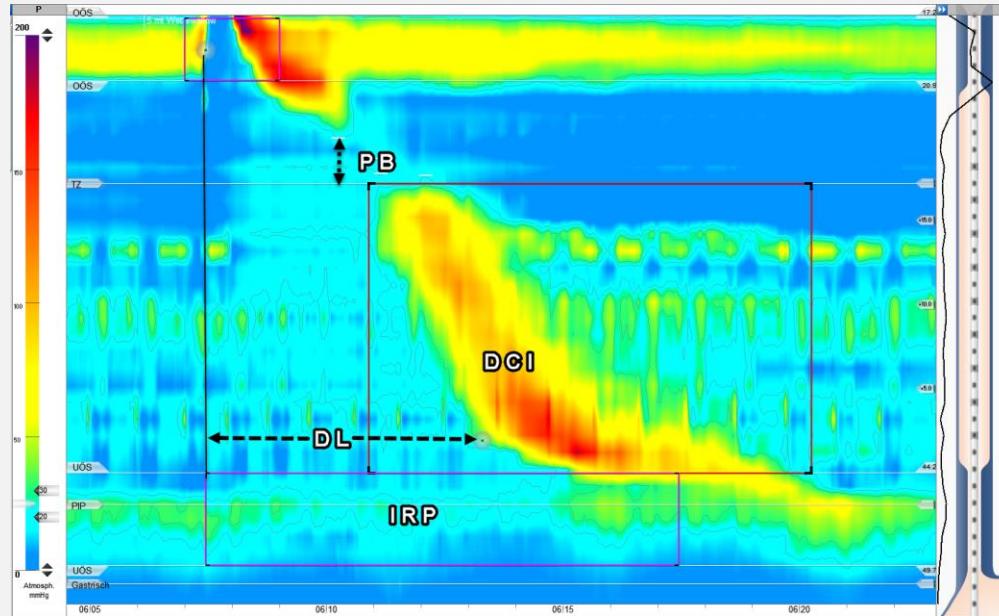

Distal Latency (DL, s):

Interval between UES relaxation and the contractile deceleration point (CDP). The CDP represents the inflection point along the 30 mmHg isobaric contour at which propagation velocity slows. The CDP must be localized within 3 cm of the proximal margin of the LES.

Peristaltic Break (PB, cm):

Breaks in the 20 mmHg isocontour.

PRESSURE TOPOGRAPHY METRICS

Apply metrics

PB = Peristaltic Break

DCI = Distale Contractile Integral

DL = Distal Latency

IRP = Integrated Relaxation Pressure

Score individual swallows:

LES Relaxation: IRP

Contraction vigor: DCI

Contraction pattern: DL + PB

Pressurization pattern

SCORING OF INDIVIDUAL SWALLOWS I

IRP (referenced to intragastric pressure):

IRP measurements are technology- and device-specific.

Upper limit of normals (examples):

Sierra circumferential sensors: 15 mmHg

Unisensor circumferential sensors (MMS, Sandhill): 21 mmHg

Dentsleeve water perfused system: 19 mmHg

Intrabolus pressure pattern (30 mmHg isobaric contour referenced to atmospheric)

Panesophageal pressurization :

Uniform pressurization of >30 mmHg extending from the UES to the EGJ

Compartmentalized esophageal pressurization:

Pressurization of >30 mmHg extending from the contractile front to the EGJ

EGJ pressurization:

Pressurization restricted to zone between the LES and CD in conjunction with
LES-CD separation

Normal:

No bolus pressurization >30 mmHg

SCORING OF INDIVIDUAL SWALLOWS II

Contraction vigor

Failed: DCI <100 mmHg.s.cm

Weak: DCI >100 mmHg.s.cm, but <450 mmHg.s.cm

Ineffective: Failed or Weak

Normal : DCI >450 mmHg.s.cm and <8000 mmHg.s.cm

Hypercontractile: DCI ≥8000 mmHg.s.cm

Contraction pattern

Premature: DL <4.5 s

Fragmented: Large break (>5 cm length) in the 20-mmHg isobaric contour
with DCI >450 mmHg.s.cm

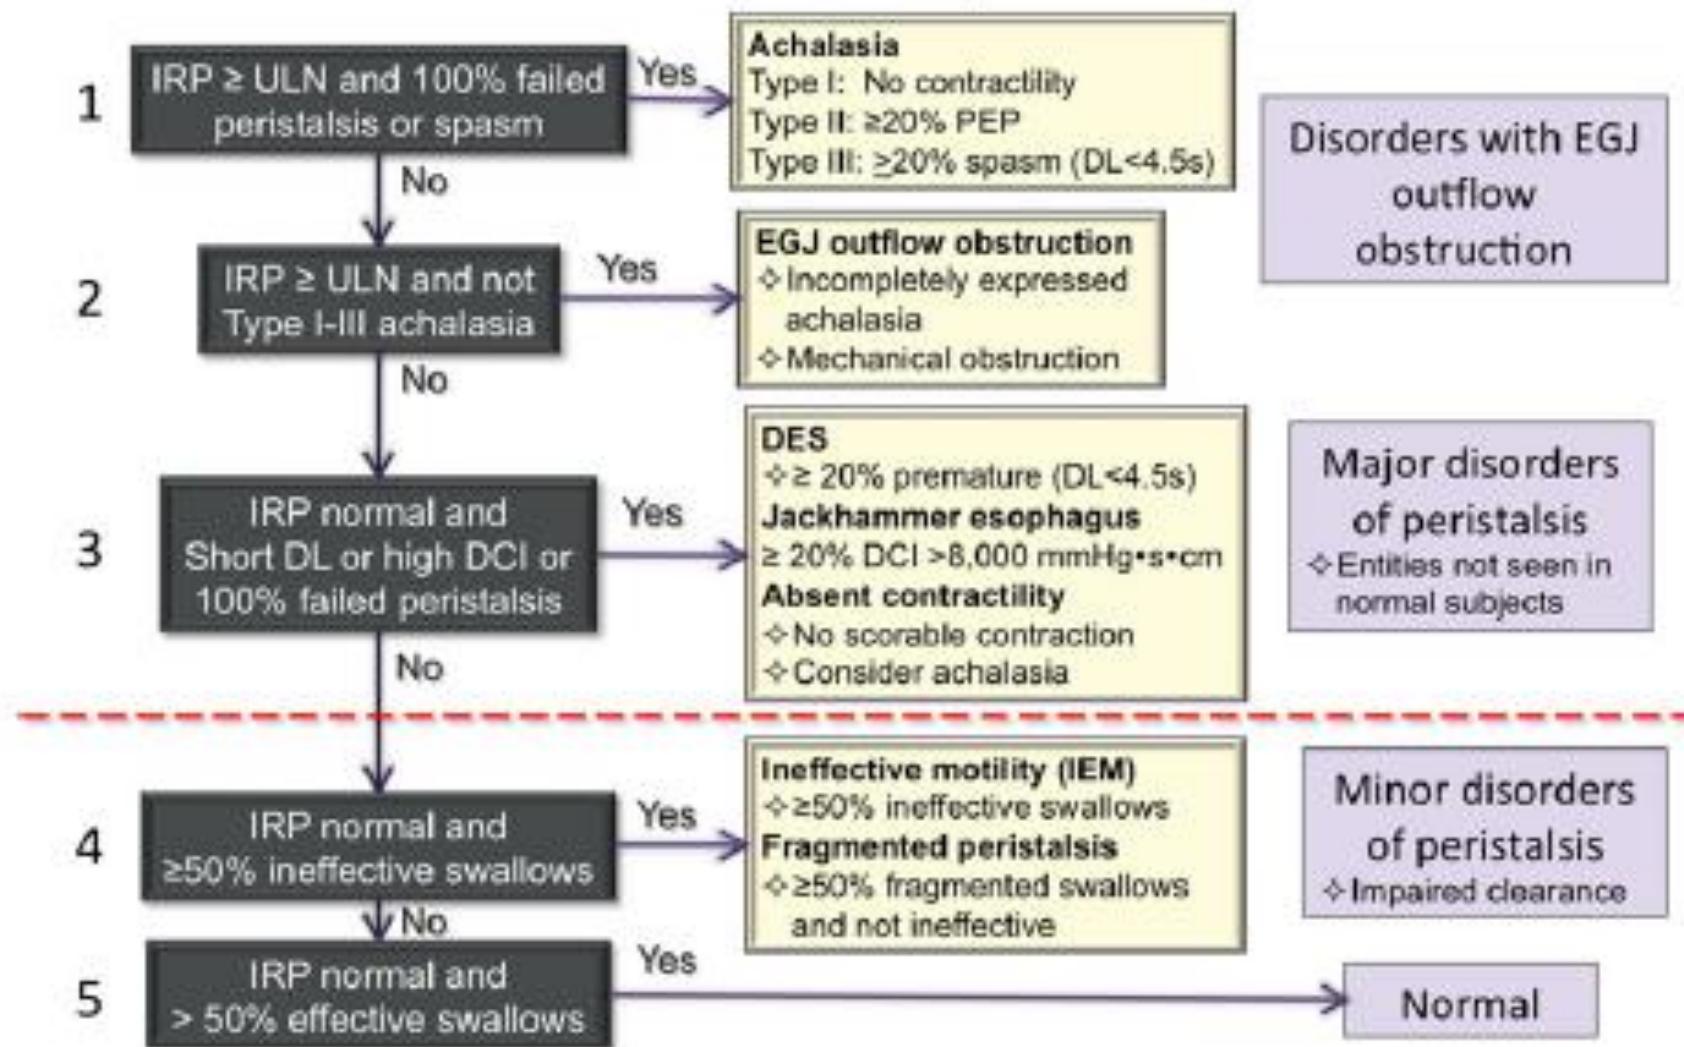

Intact: Not achieving the above diagnostic criteria

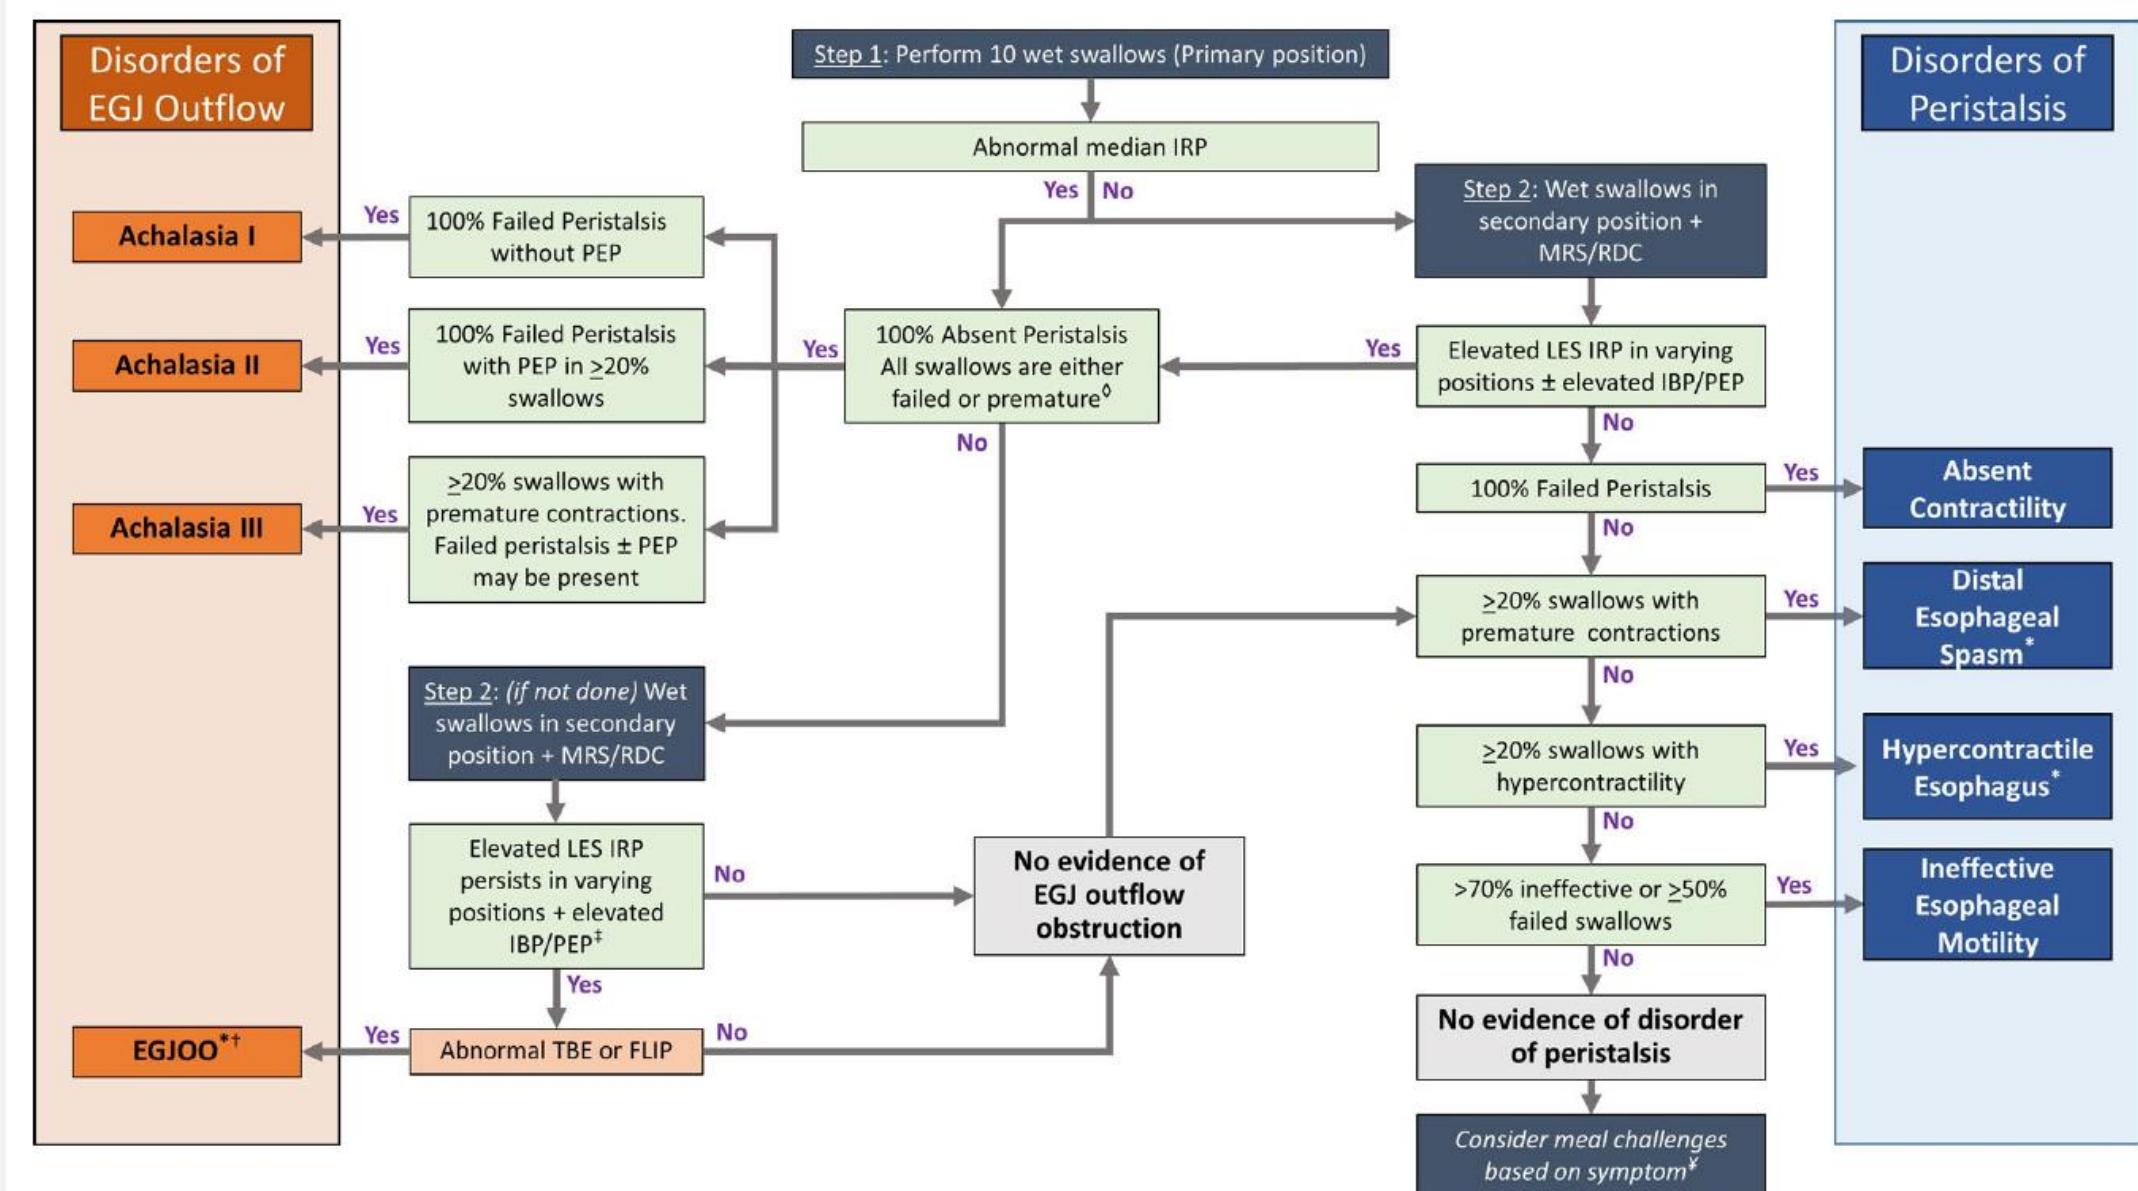

Normal swallow: IRP in normal range, DCI 450-8000 mmHg.s.cm, DL >4.5 s,
no break >5 cm in 20 mmHg isobaric contour

A QUICK GUIDE TO HRM INTERPRETATION

- Identify landmarks
- Rate EGJ pressure topography
- Apply pressure topography metrics to swallows and rate individual swallows
- Interpret HRM study in hierarchical order of findings according to the Chicago classification

The chicago classification v3.0
Hierarchical analysis

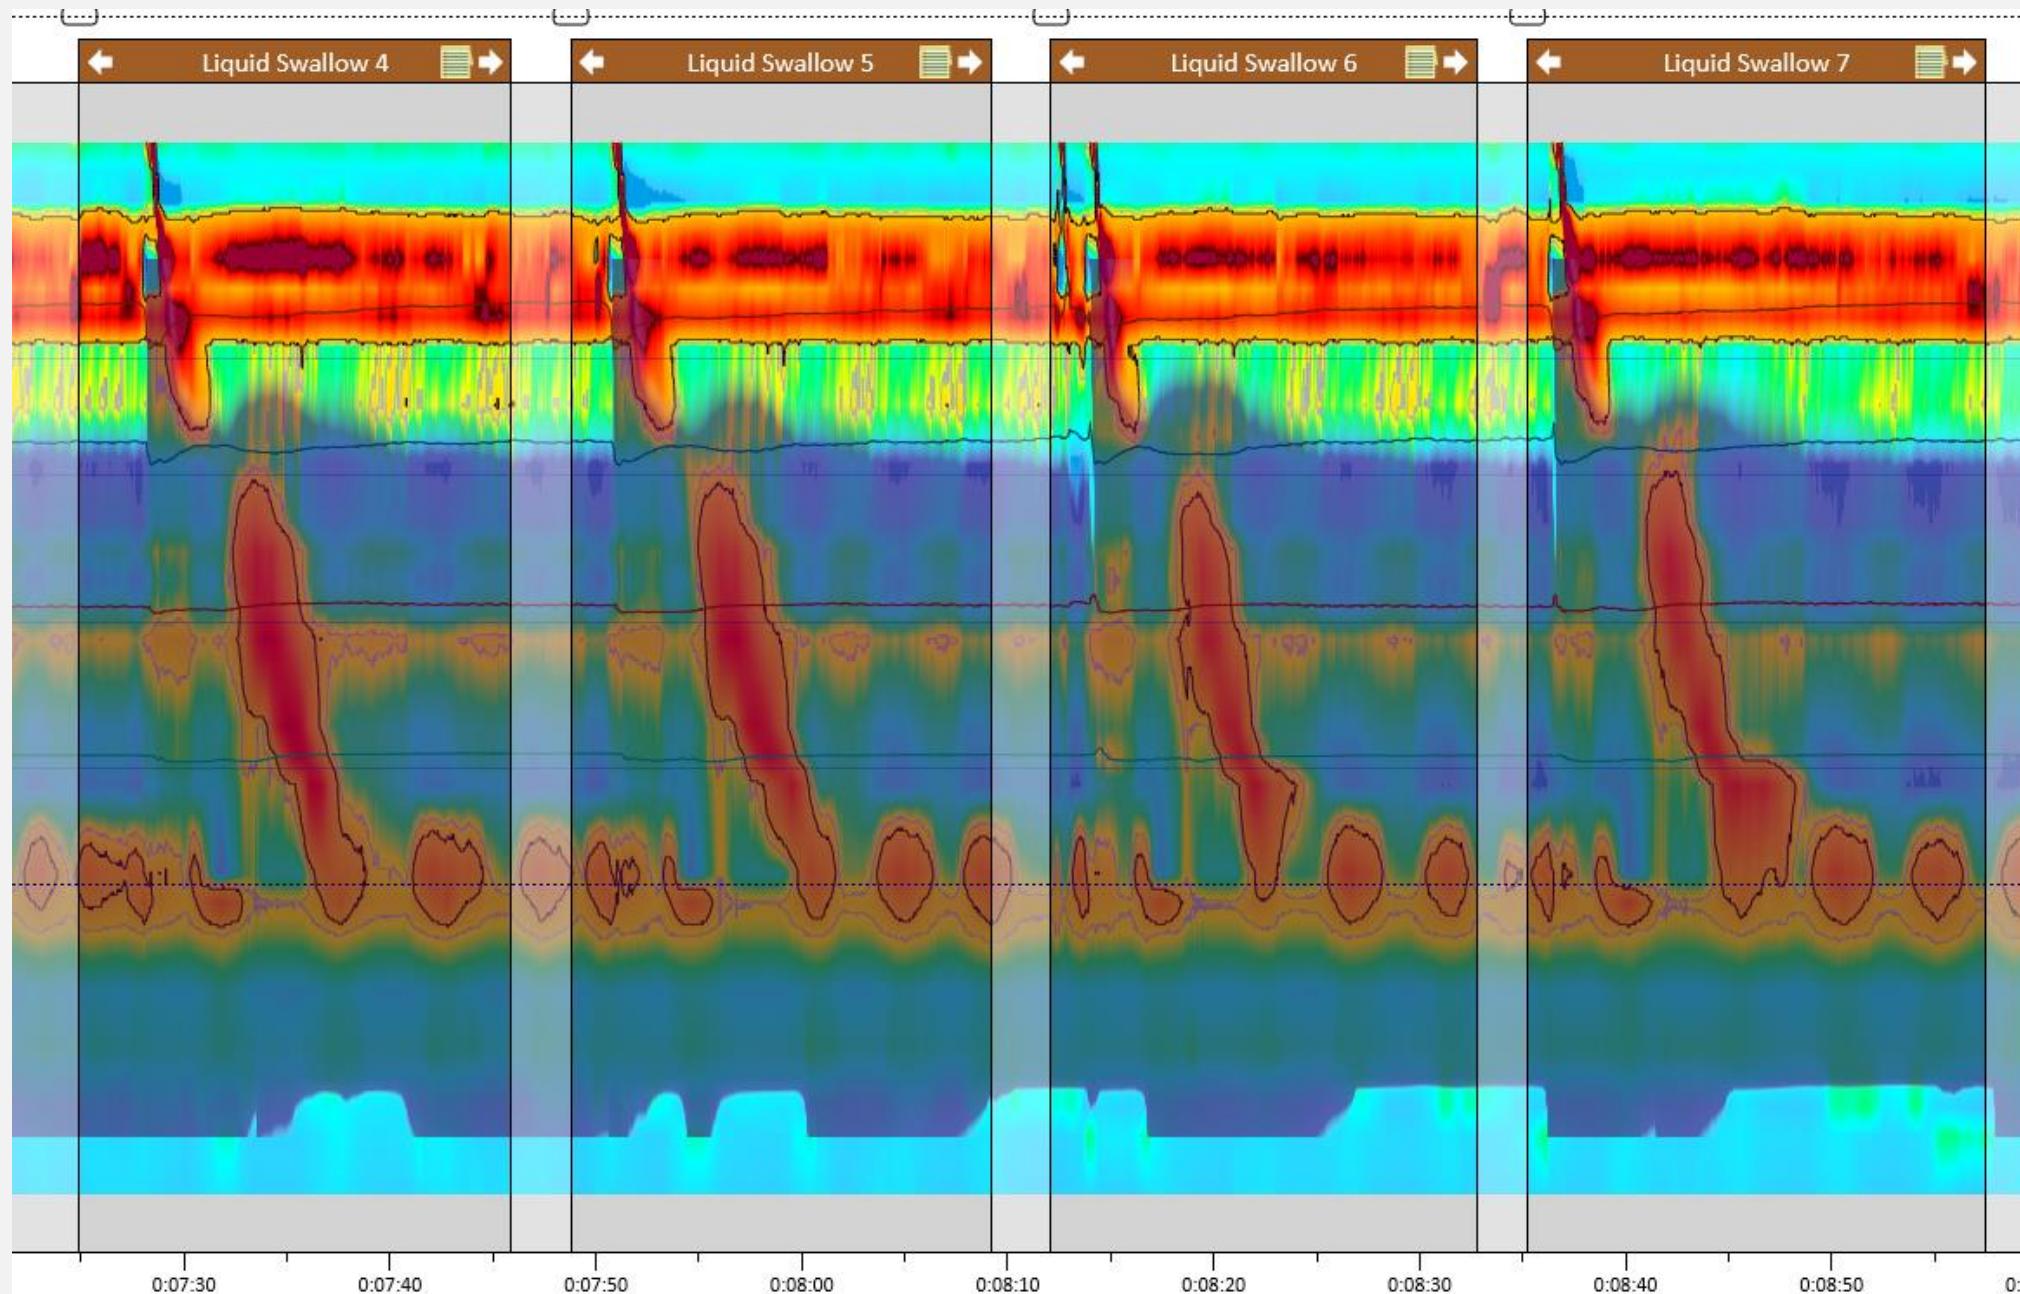

LIQUID

LIQUID

LIQUID

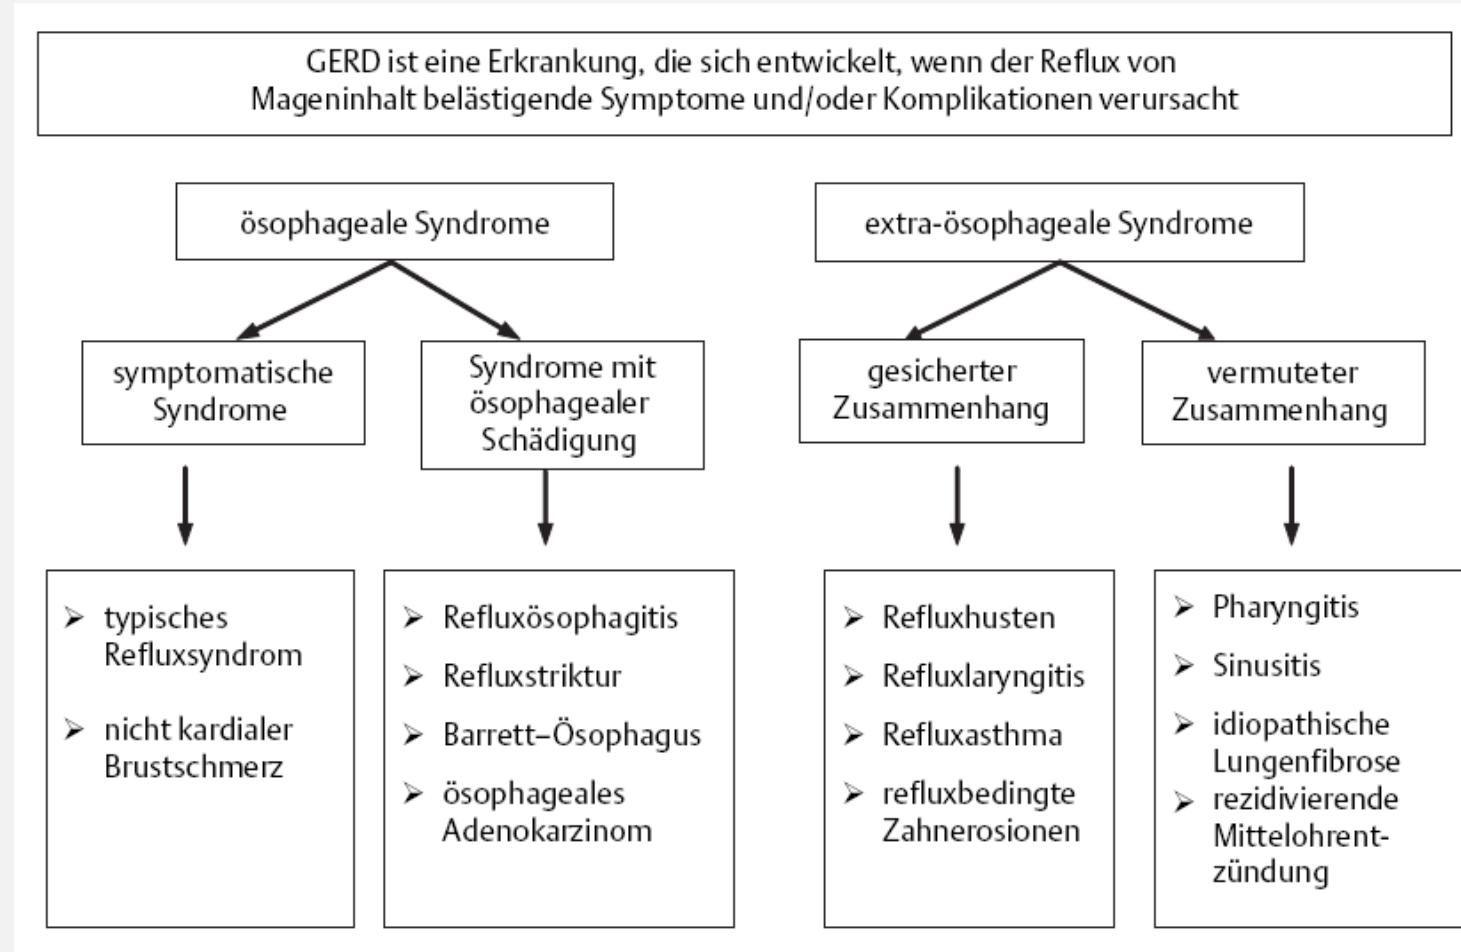

LIQUID

Liquid bolus retention despite normal esophageal body motility and borderline normal LES relaxation in a patient with eosinophilic esophagitis

MONTREAL DEFINITION DER REFLUXKRANKHEIT

ANAMNESE

Liegen nur typische Symptome vor?

Sodbrennen, saures Aufstoßen

Besteht ein Mischbild von typischen und atypischen Sy.?

z. B. Sodbrennen und Husten

Liegen nur atypische Symptome vor?

z. B. Globusgefühl und Räuspern

DIAGNOSTIK: PPI-THERAPIEVERSUCH

PPI in Standarddosierung

(1x 40 mg Esomeprazol Äquivalent 30 min. vor Mahlzeit)

Einnahmedauer 8 Wochen

Klinisches Ansprechen: Absetzversuch

Fehlendes Ansprechen: Verdoppelung der Dosis

Fehlendes Ansprechen auf doppelte Dosis: Endoskopie

PPI-THERAPIEVERSUCH AUSSAGEKRAFT

GERD: 79% pooled sensitivity (95% CI, 72%-84%)
45% pooled specificity (95% CI, 40%-49%)

ERD: 76% pooled sensitivity (95% CI, 66%-84%)
30% pooled specificity (95% CI, 8%-67%)

NERD: 79% pooled sensitivity (95% CI, 70%-86%)
50% pooled specificity (95% CI, 39%-61%)

NCCP: 79% (95% CI, 69%-86%)
79% (95% CI, 69%-86%)

19 studies (GERD 11, NCCP 8), 1691 patients

GERD: Gastroesophageal reflux disease

ERD: Erosive reflux disease

NERD: Non-erosive reflux disease

NCCP: Non-cardiac chest pain

ENDOSKOPIE UND BIOPSIE

Indikation: Kein Ansprechen auf empirische PPI-Therapie
Evaluationen von Komplikationen und Differentialdiagnosen

Aussagen:
Hochgradige Ösophagitis (LA grades C or D), Barrett-Ösophagus oder peptische Strukturen sind Beweis einer Refluxkrankheit.

Erosive Ösophagitis bei 30% PPI-naiver Patienten und bei <10% der Patienten unter PPI.

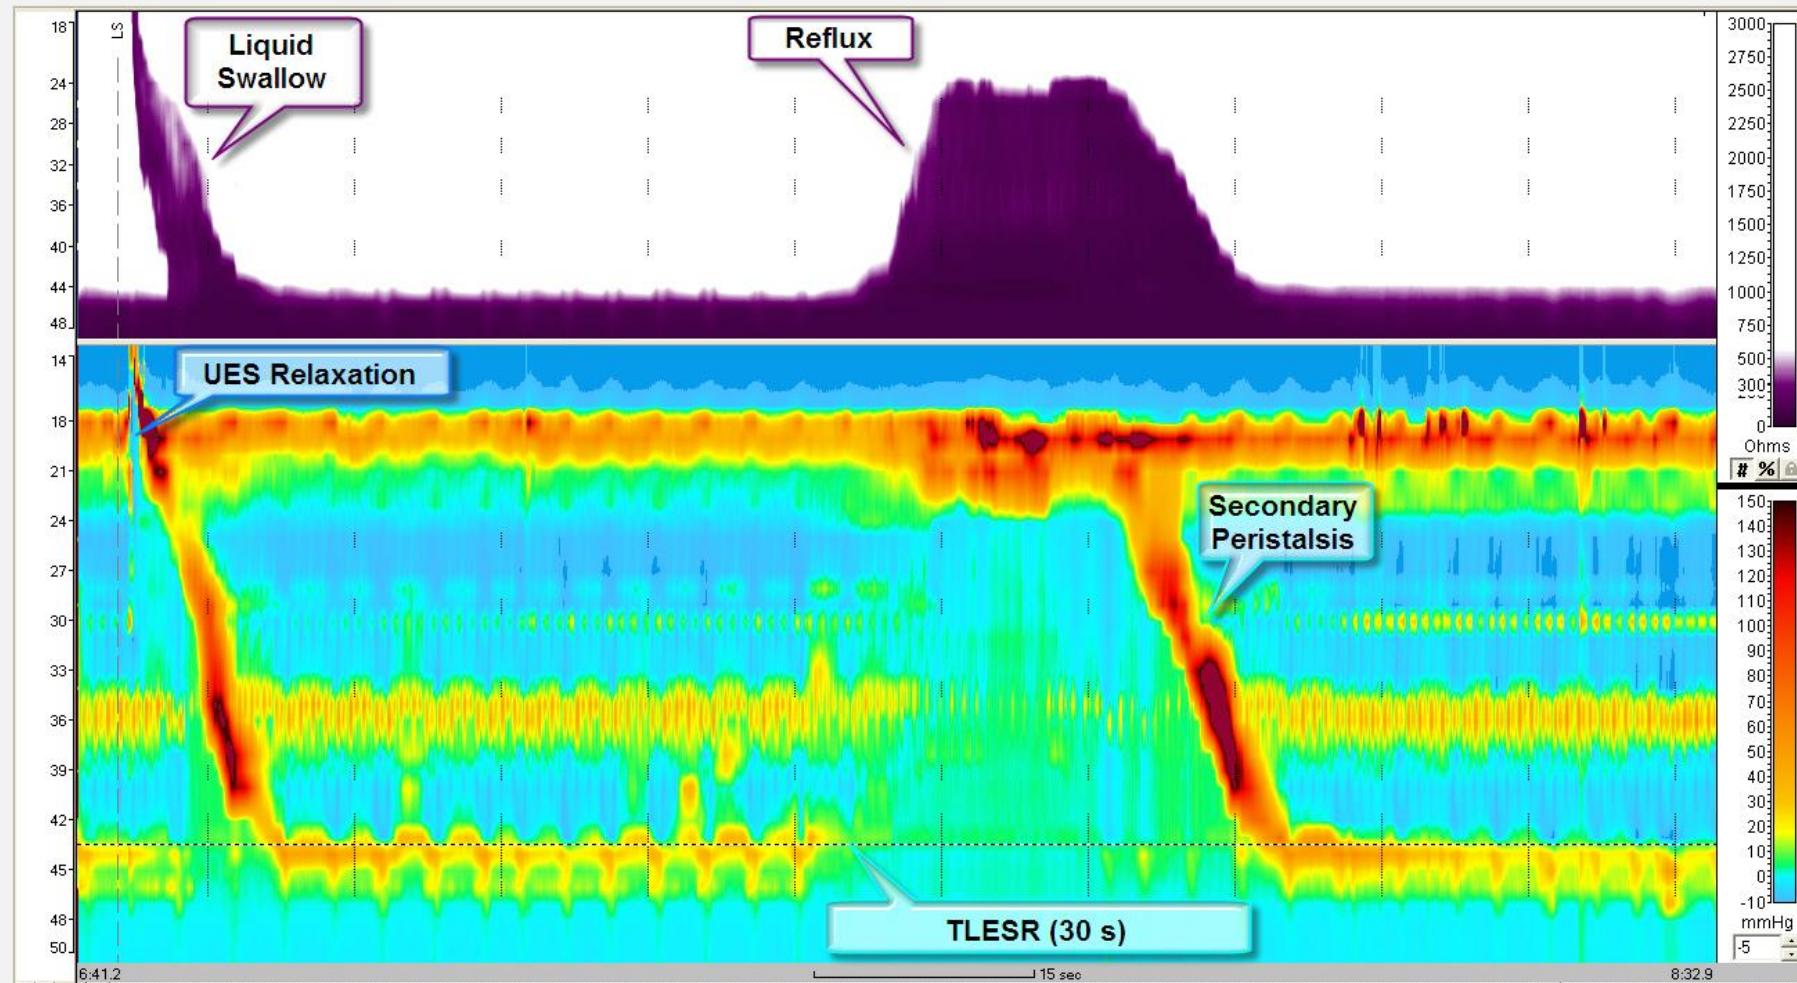

LA Grad A: nicht spezifisch (in 5%–7.5% asymptomatischer Kontrollen)

LA Grad B Ausreichende Evidenz zur Initiation einer PPI-Therapie,
zusätzliche pH-Metrie vor Antirefluxchirurgie gefordert

Rom IV Konsens: oesophageale Biopsien zum Ausschluss einer eosinophile Ösophagitis

Histopathologie: Strukturiertes histopathologisches Protokoll: Papillenelongation, Basalzellhyperplasie,
erweiterte interzelluläre Spalten, mukosale Entzündungszellen

REFLUXMECHANISMUS: TLESR

Transiente Sphincter-Relaxation (TLESR)

AMBULATORISCHES REFLUX MONITORING

Bestätigung der Diagnose Refluxkrankheit bei Patienten mit normaler Endoskopie, atypischen Symptomen oder vor Antireflux-Chirurgie.

Wireless pH monitoring (Bravo Kapsel):

Aufnahmezeit von bis zu 96 Stunden erhöht diagnostische Sicherheit

Endoskopie zur Platzierung erforderlich, aber weniger Beeinträchtigung während Aufzeichnung

Niedrige Samplingrate: kurzdaurende Refluxe nicht erfasst

Teuer

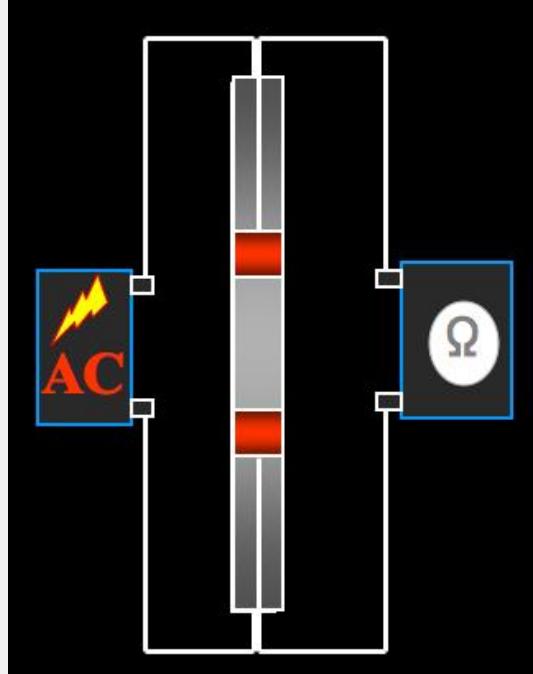

24h-Impedanz-pH-Metrie:

Charakterisiert Refluxe: Flüssig, gasförmig, gemischt, sauer, nicht sauer

Weniger Patientenkomfort

Interpretation zeitaufwändig

IMPEDANZ MONITORING

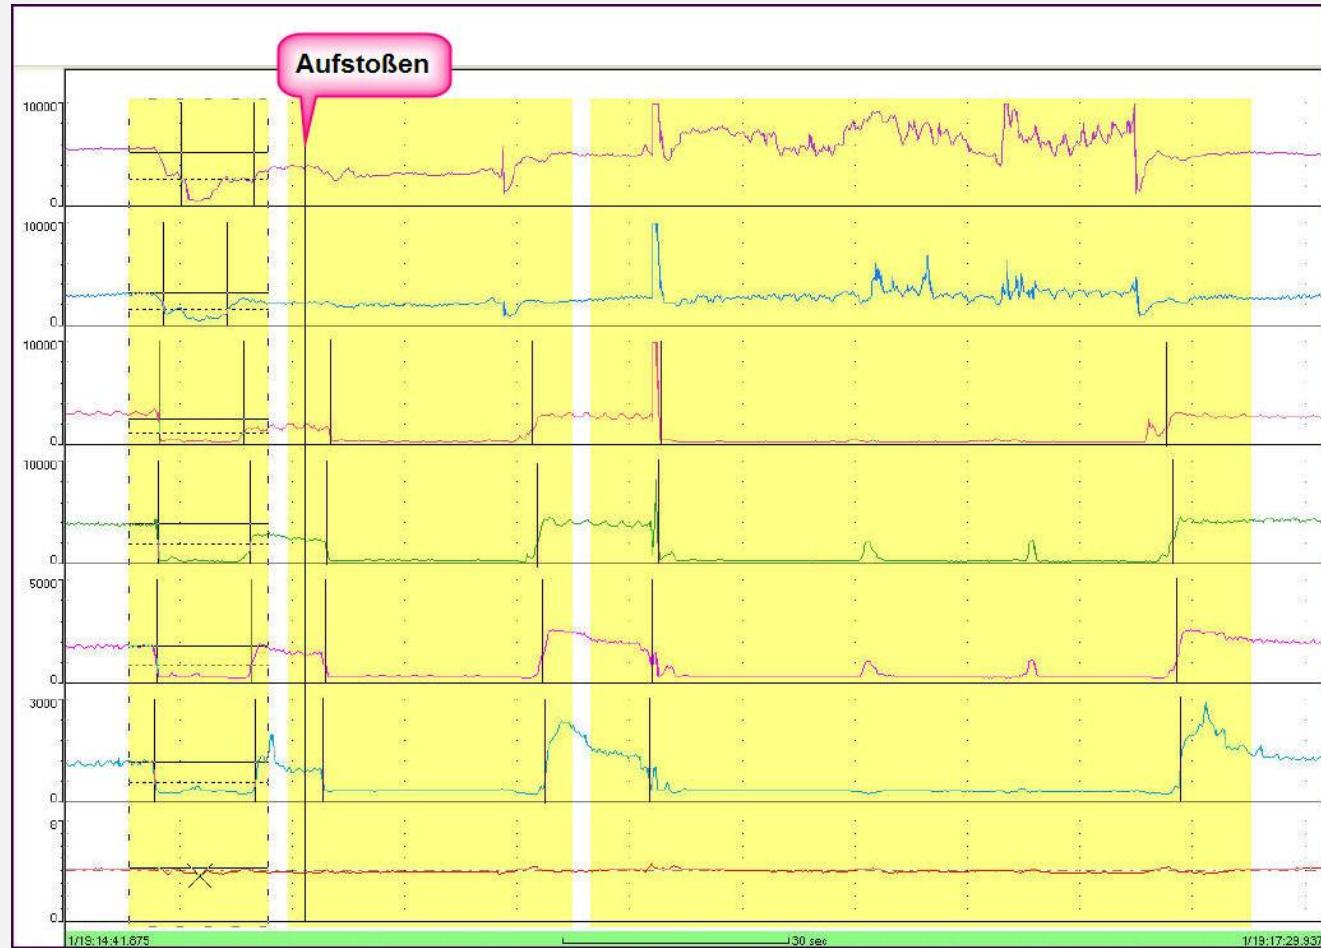

Ringelektroden an Katheter in Schleimhautkontakt
Anlage einer Wechselspannung zwischen Elektrodenpaaren
Messung des Widerstands (Impedanz)

FLÜSSIGKEITS- UND GASBEWEGUNGEN

SYMPTOMASSOZIATION

IMPEDANZ-PH-METRIE: NORMWERTE

Säureexposition

Acid Exposure Time (AET)

% Messzeit pH<4

Normal: <4.2% gesamt

<6.3% aufrecht

<1.2% liegend

Anzahl der Refluxe:

Normal: <73

Shay Am J Gastroenterol 2004; 99: 1037-43

Symptomassoziation:

Symptom Index (SI):

% Sy. < 5 min nach Reflux

Negativ: <50%

Positiv: $\geq 50\%$

Symptom Association Probability 2 min. Zeitfenster

Positiv: >95%

IMPEDANZ-PH-METRIE

Monitoring unter oder ohne PPI?

Ohne PPI:

Lyon Konsens empfiehlt Test ohne PPI bei nicht zuvor nauchgewiesener Refluxkrankheit:

keine oder niedriggradige Ösophagitis

keine positive pH-Metrie in der Vorgeschichte

Ein Test «off PPI» wird auch vor eventueller Antirefluxchirurgie vorgeschlagen

Säureexposition wichtigster Parameter

Mit PPI (doppelte Dosis):

Patient mit nachgewiesener Refluxkrankheit (Ösophagitis LA C oder D, long segment Barrett-Ösophagus oder frühere abnorme pH-Metrie LSBE)

- Symptom-Reflux Assoziation
- Inadäquate Säuresuppression
- Mangelnde Compliance

AET AND NUMBER OF REFLUXES

Acid Exposure Time (AET):

- Reproducible
- Reliably extracted from automated analysis (caveat: acidic beverages)
- Predictive of response to medical and surgical reflux therapy.

Lyon GERD Consensus proposes:

AET <4% be considered definitively normal (physiological)

AET >6% be considered definitively abnormal

Intermediate values between these limits being inconclusive.

Number of reflux episodes (acidic, weakly acidic or weakly alkaline)

- overestimated by the automated analysis, requires manual review of the tracing.

The Lyon GERD Consensus proposes:

>80 reflux episodes per 24 hours are definitively abnormal

<40 reflux episodes is physiological

Intermediate values are inconclusive.

SYMPTOM REFLUX ASSOCIATION

Analysis of the temporal association (2 min time frame) between symptoms and reflux episodes.

The Symptom Index (SI):

- percentage of symptom events preceded by reflux episodes (positive $\geq 50\%$)
- Disadvantage: chance association possible , because number of reflux episodes is not

Symptom Association Probability (SAP):

- considered positive if the probability (P value) of the observed association occurring by chance is $<5\%$.
- Considers all relevant components (number of symptom events, number of reflux episodes),

The combination of a positive SI and positive SAP provides the best evidence of a clinically relevant association between reflux episodes and symptoms.

SI and SAP are predictive of the effect of medical and surgical antireflux therapy, independent of AET.

The outcome of symptom association analysis is more reliable when at least 3 symptom events occur during the test.

NOVEL METRICS

PSPW (Post-reflux Swallow-induced Peristaltic Waves)

- discriminates patients with GERD from those with functional heartburn.
- Antegrade progression of impedance decline within 30 s of a reflux episode
- PSPW index: proportion of reflux episodes on pH-impedance monitoring followed by a PSPW.
- **Currently not programmed into the analysis software**

Baseline impedance

- Reflect the permeability of the oesophageal mucosa, linked to alteration in intercellular space and tight junctions.
- lower values found in erosive and non-erosive GERD.^{91 92} Low baseline oesophageal mucosal impedance
- Mean nocturnal baseline impedance (MNBI): averaged from three 10 min periods spaced an hour apart.
- Low MNBI (<2292 ohms) independently predicts response to antireflux therapy

Gyawali P Gut. 2018 Jul;67(7):1351-1362

ENDOSCOPY

pH or pH-IMPEDANCE

HRM

CONCLUSIVE EVIDENCE FOR PATHOLOGIC REFLUX

LA grades C&D esophagitis
Long segment Barrett's mucosa
Peptic esophageal stricture

AET>6%

BORDERLINE OR INCONCLUSIVE EVIDENCE

LA grades A&B esophagitis

AET 4-6%
Reflux episodes 40-80

ADJUNCTIVE OR SUPPORTIVE EVIDENCE*

Histopathology (score)
Electron microscopy (DIS)
Low mucosal impedance

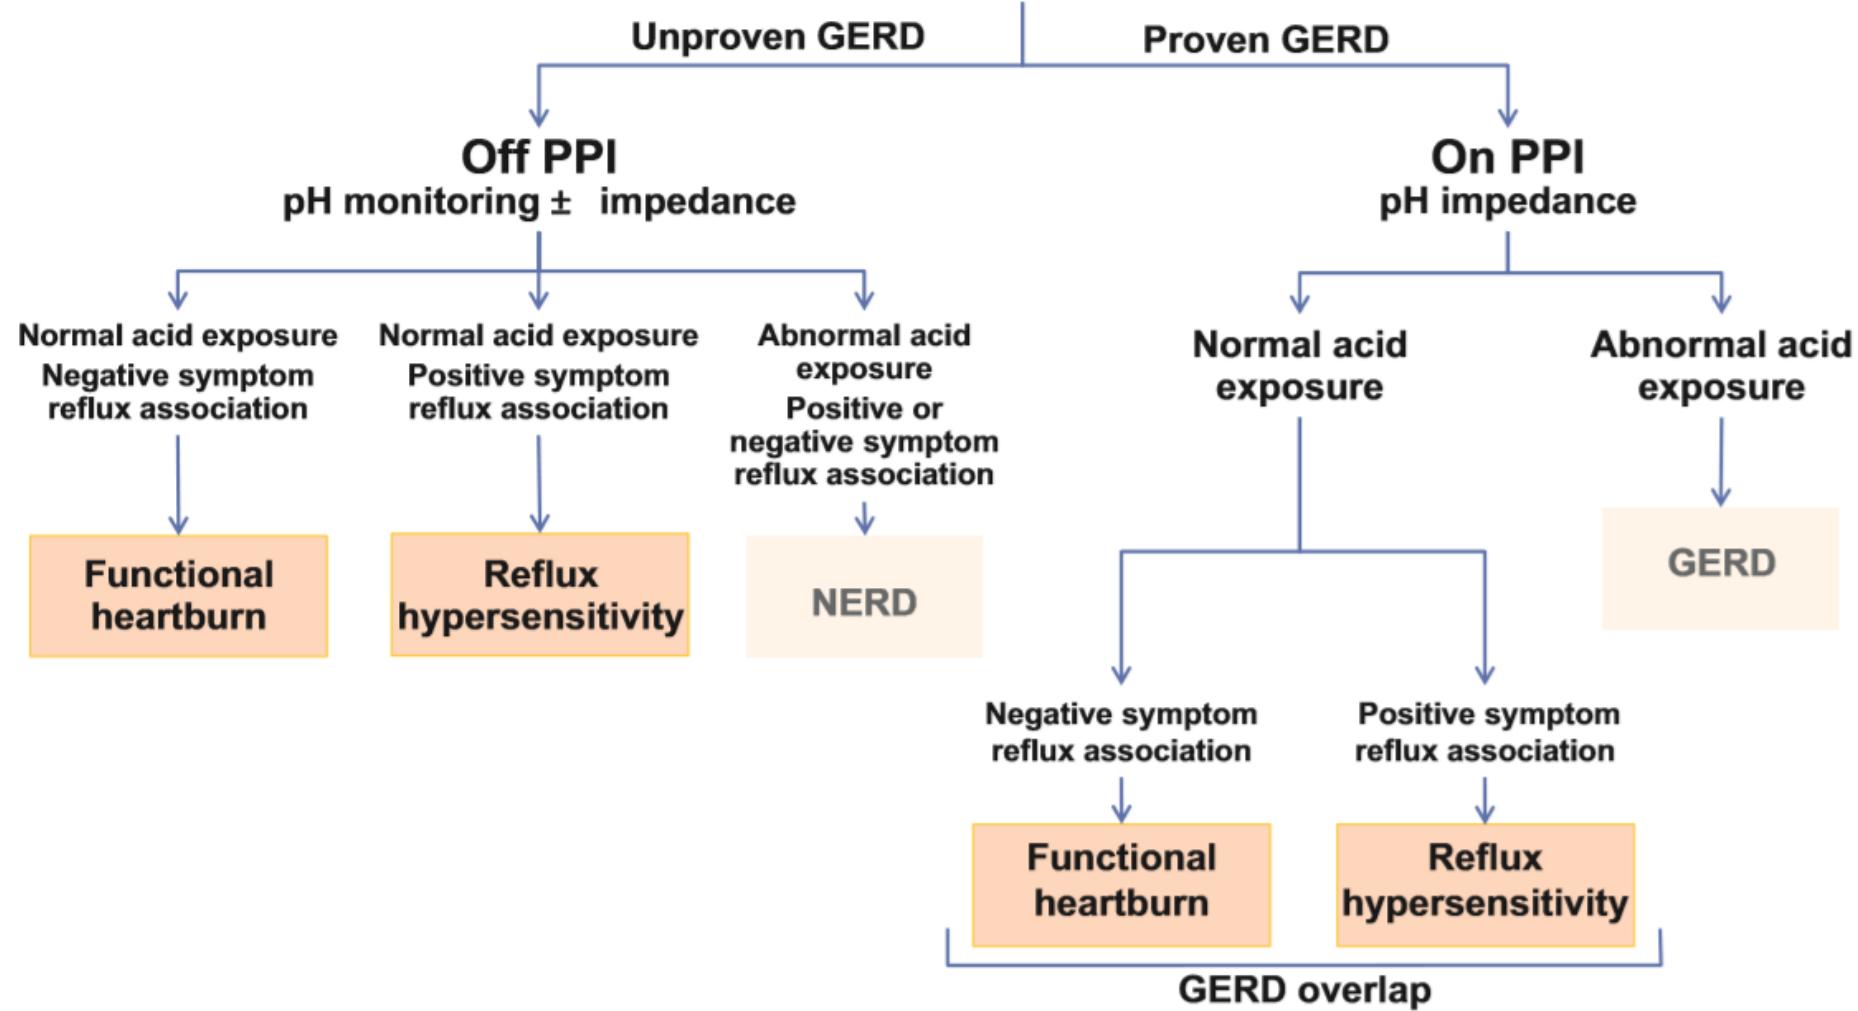

Reflux-symptom association
Reflux episodes>80
Low MNBI
Low PSPWI

Hypotensive EGJ
Hiatus hernia
Esophageal hypomotility

EVIDENCE AGAINST PATHOLOGIC REFLUX

AET<4%
Reflux episodes<40
